

Chapters 5 and 6 – Algebra Study Card

Vocabulary:

Equation – a mathematical sentence that contains an equal sign

Term – the product of a coefficient, a variable, and an exponent

Inequality- a mathematical sentence that contains $>$, $<$, \geq , or \leq

Evaluating Algebraic Expressions

Substitute the appropriate values and use order of operations to simplify

Evaluate the following when $a = 5$, $b = -3$, and $c = 8$

| | | | | | |
|------------|---------|---------------|-------------|-------------------|--------------------|
| $a + b$ | $9b$ | $4a - 3c$ | $ab + c$ | $\frac{bc}{4}$ | $4a^2 - 2b^3$ |
| $5 + (-3)$ | $9(-3)$ | $4(5) - 3(8)$ | $5(-3) + 8$ | $\frac{8(-3)}{4}$ | $4(5)^2 - 2(-3)^3$ |
| (2) | (-27) | $20 - 24$ | $-15 + 8$ | $\frac{-24}{4}$ | $4(25) - 2(-27)$ |
| | | (-4) | (-7) | (-6) | $100 - (-54)$ |
| | | | | | (154) |

Solving One Step Equations

To solve a one step equation us the inverse operation

Ex: $c - 4 = -9$ $\frac{m}{-6} = -7$

$$c - 4 = -9$$

$$+4 \quad +4$$

$$c = -5$$

$$\frac{m}{-6} = -7$$

$$(-6) \frac{m}{-6} = -7(-6)$$

$$m = 42$$

Solving Two Step Equations

Steps: 1. Add or Subtract (opposite)
2. Multiply or Divide (opposite)

Ex: $4r - 7 = -55$ $\frac{e}{5} + 12 = 9$

$$4r - 7 = -55$$

$$+7 \quad +7$$

$$4r = -48$$

$$\frac{4r}{4} = \frac{-48}{4}$$

$$r = -12$$

$$\frac{e}{5} + 12 = 9$$

$$-12 \quad -12$$

$$\frac{e}{5} = -3$$

$$(5) \frac{e}{5} = -3(5)$$

$$e = -15$$

Solving Equations with Combining Like Terms (CLT)

Combining Like Terms (CLT)

Terms are like if:

1. They have the same variable(s)
2. The variable(s) have the same exponent(s)

Be sure to use grouping symbols and take the signs in front of the coefficients

Ex: $4e + 6e$ $-6r + 11r$ $6a - 7b + 5b - 11a$

$$10e$$

$$5r$$

$$(6a - 7b + 5b - 11a)$$

$$-5a - 2b$$

Solving with Like Terms:

Ex: $5c - 9 + 7c = 135$

$$\begin{array}{r} 5c - 9 + 7c = 135 \\ 12c - 9 = 135 \\ +9 \quad +9 \\ 12c = 144 \\ \hline 12 \quad 12 \\ \hline c = 12 \end{array}$$

$-4c + 14 - 5c = 77$

$$\begin{array}{r} -4c + 14 - 5c = 77 \\ -9c + 14 = 77 \\ -14 \quad -14 \\ -9c = 63 \\ \hline -9 \quad -9 \\ \hline c = 7 \end{array}$$

Solving Equations with Variables on Both Sides (VBS)

Remember to move the smaller coefficient to the larger coefficient whenever possible

Ex: $5r = 2r - 27$

$$\begin{array}{r} 5r = 2r - 27 \\ -2r \quad -2r \\ 3r = -27 \\ \hline 3 \quad 3 \\ \hline r = -9 \end{array}$$

$7y - 12 = -3y + 68$

$$\begin{array}{r} 7y - 12 = -3y + 68 \\ +3y \quad +3y \\ 10y - 12 = 68 \\ +12 \quad +12 \\ 10y = 80 \\ \hline 10 \quad 10 \\ \hline y = 8 \end{array}$$

Solving Equations with the Distributive Property

Distributive Property

Distribute \rightarrow Multiply, use the Distributive Property to eliminate ()

Ex: $6(y - 5)$

$$\begin{array}{r} 6(y - 5) \\ 6y - 30 \end{array}$$

$-2(x - 7)$

$$\begin{array}{r} -2(x - 7) \\ -2x + 14 \end{array}$$

$9(a + 2) - 5a - 15$

$$\begin{array}{r} 9(a + 2) - 5a - 15 \\ 9a + 18 - 5a - 15 \\ 4a + 3 \end{array}$$

Solving with Distributive Property

Ex:

$$4(r-5) = 12$$

$$\begin{array}{r} 4(r-5) = 12 \\ 4r - 20 = 12 \\ +20 \quad +20 \\ \hline 4r = 32 \\ \frac{4}{4} \quad \frac{4}{4} \\ \hline r = 8 \end{array}$$

$$-3(d-11) = -18$$

$$\begin{array}{r} -3(d-11) = -18 \\ -3d + 33 = -18 \\ -33 \quad -33 \\ \hline -3d = -51 \\ \frac{-3}{-3} \quad \frac{-51}{-3} \\ \hline d = 17 \end{array}$$

Solving Equations – All Types

Checklist:

1. Use the Distributive Property to eliminate parentheses. (Distribute () \rightarrow Multiply)
2. Combine like terms (CLT) on both sides of the equation. (Combine \rightarrow Add)
3. Get the variable on one side of the equation
4. Add or Subtract (opposite)
5. Multiply or Divide (opposite)

Ex: $7(x-3) = -5x + 39$

$$\begin{array}{r} 7(x-3) = -5x + 39 \\ 7x - 21 = -5x + 39 \\ +5x \quad +5x \\ \hline 12x - 21 = 39 \\ +21 \quad +21 \\ \hline 12x = 60 \\ \frac{12}{12} \quad \frac{60}{12} \\ \hline x = 5 \end{array}$$

$-4y + 12 + 13y = 6(y-5)$

$$\begin{array}{r} -4y + 12 + 13y = 6(y-5) \\ -4y + 12 + 13y = 6y - 30 \\ 9y + 12 = 6y - 30 \\ -6y \quad -6y \\ \hline 3y + 12 = -30 \\ -12 \quad -12 \\ \hline 3y = -42 \\ \frac{3}{3} \quad \frac{-42}{3} \\ \hline y = -14 \end{array}$$

Solving Equations-Word Problems

When solving a word problem algebraically don't forget to include a Let statement

Ex: The Richardson family is looking to rent a tent for their child's graduation party this spring. Syracuse Tents and Events charges a fee of \$50 per hour plus a delivery fee of \$79.99. Century Party Rentals has a fee of \$65 per hour with a delivery fee of \$42.49. How many hours would the family need to rent the tent for the cost of the companies to be equal?

Let h = the # of hours

$$\begin{array}{r} 50h + 79.99 = 65h + 42.49 \\ -50h \quad \quad -50h \\ \hline 79.99 = 15h + 42.49 \\ -42.49 \quad \quad -42.49 \\ \hline 37.50 = 15h \\ \frac{37.50}{15} = \frac{15h}{15} \\ 2.5 = h \end{array}$$

Graphing Inequalities

$>$ and $<$ \rightarrow Open circle (not part of solution)

\geq and \leq \rightarrow Closed circle (part of solution)

Ex: $x > -3$

$x \leq 7$

$-4 < x \leq 5$

Solving Inequalities

Remember: When you multiply or divide by a negative you must flip the inequality symbol

Ex: $-6x - 13 \geq -43$

$$\begin{array}{r} -6x - 13 \geq -43 \\ +13 \quad +13 \\ \hline -6x \geq -30 \\ \frac{-6x}{-6} \geq \frac{-30}{-6} \\ \text{Flip symbol} \\ x \leq 5 \end{array}$$

$-4z - 13 > z - 33$

$$\begin{array}{r} -4z - 13 > z - 33 \\ +4z \quad +4z \\ \hline -13 > 5z - 33 \\ +33 \quad +33 \\ \hline 20 > 5z \\ \frac{20}{5} > \frac{5z}{5} \\ 4 > z \end{array}$$

Solving Inequalities – Word Problems

Remember to include a let statement

Tony is a delivery man for Trappers Pizza Pub. He earns a salary of \$10.65 plus any tips he receives from a delivery. What is the least number of hours Tony can work on Saturday if he makes \$40 in tips and wants to make at least \$100?

Let h = the # of hours

$$\begin{array}{r} 10.65h + 40 \geq 100 \\ -40 \quad | \quad -40 \\ \hline 10.65h \geq 60 \\ \underline{10.65} \quad | \quad \underline{10.65} \\ h \geq 5.633\dots \end{array}$$

6 hours
